

- [✉ Contact Users](#) : open the default mailbox on the local computer in order to send and email to a selection of users (i.e. search field). The user has then to paste the email addresses from the clipboard.

Note the **Duration** column represents the use time left of devices which is decremented each time a group repetition is done, until the group termination.

The group **Duration** is calculated as follow over time: **(Expiration Date – Starting Date) * (Repetitions + 1) * Devices**

So, by updating the consumed duration quota over time for a group X, it is possible to release some resources in order to add new devices into one or more other groups, without waiting for the effective termination of the considered group X.

5.6 Monitoring devices

Selecting the **Devices** tab, it is possible to customize the view by adding columns relating to the Group feature, as shown in the Figure 15 below.

Lea view

The screenshot displays the STF web interface. At the top, there's a navigation bar with 'Control', 'Devices', 'Groups', and 'Settings' tabs. Below this, a summary bar shows 'TOTAL DEVICES: 3', 'USABLE DEVICES: 2', 'BUSY DEVICES: 1', and 'LEA: 0'. The main content area is divided into two sections: 'Devices' and 'Details'. The 'Devices' section contains a table with columns: Status, Product, OS, Location, User, Group Name, and Group Class. The table lists three devices: 'Use' (F3111, 6.0, MyLocation, MyOrangeDev, daily), 'Use' (F8331, 6.0.1, MyLocation, Common, standard), and 'Busy' (ALE-L21, 6.0, MyLocation, bob, MyOrangeDev, daily). The 'Details' section is currently empty. A 'Customize' button is visible, which has opened a menu to select columns. The menu lists various attributes, and a red circle highlights the group-related columns: 'Group Name', 'Group Class', 'Group Starting Date', 'Group Expiration Date', 'Group Repetitions', 'Group Owner', and 'Group Origin'.

Figure 15: add group columns to lea Devices view

By default, group columns are not enabled in order to keep the default behaviour of STF, so don't hesitate to customize them to fit your preferences!

Note the **Group Name** column corresponds to the name of the current group of the device.

The above **lea** view illustrated by the Figure 15 shows that **bob** is currently using the ALE-21 model during an active state of **MyOrangeDev** group.

It shows also that **lea** may access to all devices because she belongs to both **Common** and **MyBookableGroup** groups.
